

How Does RON Work?

Remote Online Notarization ("RON") is a new, technology-driven notarial process that allows the signer to appear before the notary over a live audio-video feed when executing digital documents.

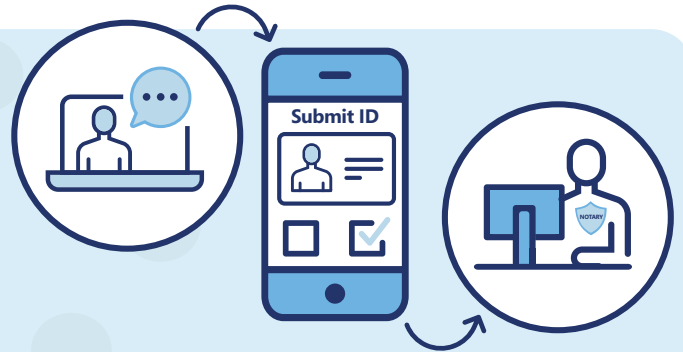

STEP 1

Identity Verification

RON uses the latest identity verification technologies to make notarizations more secure.

- A. Signer passes a knowledge-based identity quiz
- B. Signer submits ID for review
- C. Third-party software performs forensic test on ID

STEP 2

Audio-Video Conference

The notary and signer talk to each other over a webcam in real-time and observe the necessary digital signatures and seals being added to the digital documents.

STEP 3

"Tamper-Sealed" Documents

The notary adds a "tamper-seal" to date/time-stamp the notarized documents. The seal will indicate whether any of the documents are altered in the future. The signer downloads a PDF of the completed, digitally signed and digitally notarized, document.

STEP 4

Audit Trail and Notary Records

Like with traditional notarizations, the notary keeps a journal logging the basic details of the notarization. The journal can be kept in a secure digital format that includes a video of the notarial act, which can be used to prove who actually digitally signed the document.
