

# How Does RIN Work?

Remote Ink Notarization ("RIN") is a new, technology-driven notarial process that allows the signer to appear before the notary over a live audio-video feed when executing wet signed paper documents.

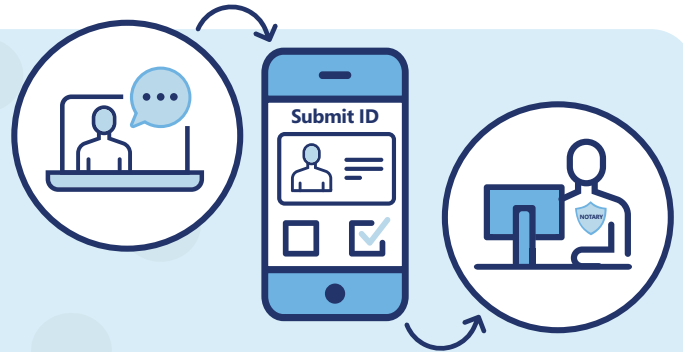

## STEP 1

### Identity Verification

RIN uses the latest identity verification technologies to make notarizations more secure.

- A. Signer passes a knowledge-based identity quiz
- B. Signer submits ID for review
- C. Third-party software performs forensic test on ID

## STEP 2

### Audio-Video Conference

The notary and signer talk to each other over a webcam in real-time and observe the necessary wet signatures being added to the paper documents.

## STEP 3

### Paper Documents and Declaration

The signer displays their wet signed paper document via webcam to the notary. In addition, the signer will sign a declaration under penalty of perjury stating that they signed the document in the presence of the online notary. The effective date on the documents signed is the date on which the principal signed the declaration.

## STEP 4

### Audit Trail and Notary Records

Like with traditional notarizations, the notary keeps a journal logging the basic details of the notarization. The journal can be kept in a secure digital format that includes a video of the notarial act, which can be used to prove who actually wet signed the document.
